Title	Description
Impact and Lineage Analysis Diagram Support for BW Data Transfer Process	A new link type (dashed line) has been added to the Impact and Lineage Analysis diagram for Data Transfer Processes (DTPA) and their associated Transformations (TRFN) across all BW systems. You can gain complete data traceability control by visualizing how one or more transformations are connected to and used within Data Transfer Processes (DTPs), enabling better understanding of data flow and dependencies in your BW environment. See Catalog Asset Details.
New Data Centers	SAP Business Data Cloud is now available in the following data centers: • Switzerland - EU Access (CH20). This data center does not offer the SAP Databricks and the SAP Business Data Cloud Connect solutions. For more information, see **EU Access** on the Provisioning SAP Business Data Cloud Applications page. • Australia (AP20). This data center does not offer the SAP Databricks solution. • Singapore (AP21). This data center does not offer the SAP Databricks solution. See Data Center Availability in SAP Business Data Cloud.
Share Data Products to SAP Datasphere, Data Composer	SAP Datasphere, Data Composer is a service available within SAP Business Data Cloud. It harmonizes and unifies customer data from multiple available data products. The composer consolidates disparate records into comprehensive customer profiles by using configurable unification rules and advanced identity resolution. Users can choose between deterministic models, which use rule-based and exact matching, or probabilistic models, which use machine learning for flexible matching. These models help resolve identities, handle data conflicts, and merge records based on data quality, ingestion timestamp, and rule priority. The composer also supports mapping and transforming source data attributes to a fixed output schema. This ensures data normalization and quality. The harmonized profiles are output as a data product called Potential Customer Profile. Other systems can then consume this data product. The data composer helps organizations create a single, trusted view of customers by integrating fragmented data from different business units and systems. This improves data quality, supports compliance, and enhances customer insights for analytics, personalization, and operational efficiency. By automating identity resolution and profile unification, the composer reduces manual data reconciliation, accelerates time-to-value, and supports scalable, secure data management in complex enterprise environments. For more information, see SAP Datasphere, Data Composer.
New Data Centers	SAP Business Data Cloud is now available in the following data centers: • Dammam (SA30) data center for regulated customers, • Dammam (SA31) for non-regulated customers. Note that both data centers do not offer the SAP Databricks solution. See Data Center Availability in SAP Business Data Cloud.

Title	Description
Data Product Statuses	Introducing new and more granular product statuses, which are aligned with the Catalog and provide a more detailed view of data product provisioning and lifecycle. These statuses allow you to monitor each data product more effectively and take action quickly when issues occur. See Installing Intelligent Applications and Activating Data Packages.
Installing an Intelligent Application for Two or More Source Systems	If your SAP Datasphere is part of an SAP Business Data Cloud formation, you can now install a single intelligent application multiple times for different source systems. Each source system creates (or re-uses) its own ingestion space to contain its data products. Source-specific preparation and application spaces identified by an alias are created for each instance of the intelligent application. See Installing Intelligent Applications.
Uninstallation/Deactivation in case of Commercial Entitlement Loss	In cases of expiry or termination of the commercial entitlement, a dedicated status is now displayed for the intelligent application/data package, providing visibility over the missing entitlement to both SAP Business Data Cloud cockpit users and the SAP back office. In additon, automatic uninstallion/deactivation in such cases no longer takes place, reducing the risk of data loss. Now only the BDC cockpit user can uninstall intelligeng applications or deactivate data packages. For more information, see Uninstalling Intelligent Applications and Deactivating Data Packages.
New Data Centers	SAP Business Data Cloud is now available in the Frankfurt EU Access (EU11) data center. Note that this data center does not offer the SAP Databricks and the SAP Business Data Cloud Connect solutions. See Data Center Availability in SAP Business Data Cloud. For more information, see **EU Access** on the Provisioning SAP Business Data Cloud Applications page.
BW Query Objects (ELEM) from SAP BW 7.5 Included in the Impact and Lineage Analysis Diagram for an SAP Analytics Cloud Model or Story	When viewing the **Impact and Lineage Analysis** diagram for an SAP Analytics Cloud model or story that uses data from a live data connect, users will be able to see BW Query (ELEM) objects from SAP BW 7.5 in the analyzed object's lineage. See Catalog Asset Details.
Integration with SAP HANA Cloud	SAP HANA Cloud is a fully managed cloud database platform offered as a service. You can now integrate an instance of SAP HANA Cloud with your SAP Business Data Cloud landscape as a data product consumer. See Sharing Data Products to SAP Systems.
New Data Centers	SAP Business Data Cloud, including all core solutions, is now available in the Canada (CA20) data center. See Data Center Availability in SAP Business Data Cloud.
Migrate Catalog Content from a Standalone SAP Datasphere Setup to an Integrated Setup with SAP Business Data Cloud	Organizations transition to using SAP Business Data Cloud by rewiring their standalone SAP Datasphere and SAP Analytics Cloud systems to SAP Business Data Cloud. The migration of catalog content begins automatically once you add the SAP Datasphere system to an SAP Business Data Cloud formation. If you had previously rewired your systems before this feature was available, you can still migrate the catalog content from the previous setup to the new one. During the catalog migration, personal data in the form of user favorites will also be migrated.

Title	Description
	See Migrating Catalog Content.
Intelligent Application/Data Package Incompatibility Alerts	Version incompatibility with data provider systems is now enforced at the point of activation/installation, with clear error messaging and disabled actions where needed. This improves the BDC Cockpit administrator experience since all available intelligent applications/data packages for which entitlement exists, regardless of version incompatibility, are now listed in the **Available** tab. See Minimum System Version Incompatibility for Intelligent Applications and Minimum System Version Incompatibility for Data Packages.
Information About Objects for a Data Product's API is Available	As users discover data products in the catalog, they can get more information about objects for a data product's API from the data product details page. This additional information will help users better understand a data product before they install it to an SAP Datasphere space or share it to a target system. See Data Product Details.
New Data Centers	SAP Business Data Cloud, including all core solutions, is now available in the following data centers: Korea (AP12), Brazil (BR10, BR20). See Data Center Availability in SAP Business Data Cloud.
Provide Additional System Details when Sharing Data Products	When sharing data products, you'll be able to see the following additional system details: system type, deployment region, and system ID.
SAP Business Data Cloud Connect Available in the SAP Business Data Cloud Capacity Unit Estimator	By using the SAP Business Data Cloud Capacity Unit Estimator, you can estimate the amount of capacity units necessary for using SAP Business Data Cloud Connect. Log into SAP for Me to access the estimator.
Tracking User Activities	You can track the user activities related to the intelligent applications and data packages in the **Activities** section of the SAP Business Data Cloud cockpit. The tracking includes the installation, uninstallation, update, repair, and cleanup of intelligent applications. It also includes the activation, deactivation, updates, repair, and cleanup of the data packages. Along with tracking the activities, you can verify the correlation ID per activity and the description in case of failure. See Tracking User Activities.
Usability Enhancements in the **Intelligent Applications and Data Packages** Section.	Improved usability in the **Available** and **Installed** tables allows you to sort by all columns and expand them for better visibility, streamlining the search for intelligent applications and data packages. Tooltips provide quick access to information about recently viewed items, enhancing efficiency.
Release of SAP Business Data Cloud Connect	SAP Business Data Cloud Connect is now available on major hyperscalers: Amazon Web Services (AWS), Google Cloud Platform (GCP), and Microsoft Azure. This capability facilitates secure zero-copy sharing as well as the receiving of data products via Delta Sharing between SAP BDC and supported external systems hosted on these cloud platforms. Customers using both SAP BDC and Databricks can now share data products bidirectionally to accelerate their advanced analytics and AI/ML use cases. See Provisioning SAP Business Data Cloud Connect.
Integration with SAP SuccessFactors	SAP SuccessFactors is a cloud-based human capital management software that helps organizations manage their entire workforce, from hiring to retirement. You can now integrate an instance of SAP SuccessFactors with your SAP Business Data Cloud landscape as a data provider. See Integrating SAP SuccessFactors.

Title	Description
Onboarding Guide	The onboarding guide for SAP Business Data Cloud is now available. See Onboarding.
Improved Metadata Extraction Monitoring for Data Products	Enhanced monitoring of metadata extraction for data products helps users with the Catalog Administrator role ensure that the content in the catalog is reliable. • Metadata extraction errors are detected early and are more visible in the extraction summary logs and on the data product details page. • Source systems that have data products or APIs with extraction issues are automatically resynchronized with the catalog to update the data products. • Manually synchronizing source systems will also update data products that have errors. Catalog users won't be able to install data products that have outdated APIs. See Installing Data Products.
Share Data Products to SAP HANA Cloud	Users with the appropriate privileges can share data products to SAP HANA Cloud. See Sharing Data Products to SAP Systems.
Share Data Products from Existing Databricks Systems to SAP Business Data Cloud	Users can share data products from existing Databricks systems to SAP Business Data Cloud.
Data Subscription (DSUB) Objects Available in the **Assets** Collection	Data subscriptions created by the data product generator in SAP BW/4HANA systems are available in the catalog. With them, SAP BW is pushed to SAP Datasphere local tables. When viewing the details page for a data subscription, you will be able to see its properties and open a link to the target SAP Datasphere local table. Here, you can analyze the object by viewing the **Impact and Lineage Analysis** diagram. **Note** The minimum version required is SAP BW/4HANA 2023 Support Package Stack 4 or newer. See SAP Note 3601550. See Connecting to an SAP BW System.
Display User-Friendly System Name in **Impact and Lineage Analysis** Diagram	When viewing the **Impact and Lineage Analysis Diagram** diagram for an object, the container that represents the source system will show a user-friendly business or technical name that is extracted from the source system. Containers for systems not connected to the catalog show the system type and the word "unmonitored".
Share Data Products to Existing Databricks Systems	Users with the appropriate permissions can share data products to existing Databricks systems. See Sharing Data Products to SAP Systems.
Provision SAP Business Data Cloud Connector for Supported External Systems	You can provision the SAP Business Data Cloud (BDC) connector for supported external systems to set up a dedicated, integrated environment for advanced data processing within SAP BDC. See Provisioning SAP Business Data Cloud Connect.

Title	Description
Installation Statuses	You can now see the installation status of individual data products and content objects within a data package or intelligent application, in addition to the already existent general status. This allows you to monitor each component's installation more effectively and take action if required when there is a failed installation status.
Automatic Synchronization after Application Upgrade	After an application upgrade, source systems with detected changes are automatically synchronized with the catalog. Changes may include correcting metadata inaccuracies or resolving errors and bugs within data products. These updates to data products and assets do not update the object's version number.
Delta Share Data Products Available in the **Data Products** Collection	In SAP Datasphere, data providers can use the data sharing cockpit to create data products with the **Delta Sharing** output port. These data products are then available in the **Data Products** collection. This enhancement unifies how catalog users search for and access data products in the catalog. Delta Share data products are created by data providers that have a profile with the marketplace visibility option set to **Formations**. See Creating Delta Share Data Products. SAP Datasphere systems can now be a source system for both assets and data products. To help users locate the systems on the **Metadata Extractions**, the source systems are organized into groups based on the objects extracted: assets only, APIs only, and both assets and APIs. See Connecting Source Systems.
Bundled SAP Cloud Identity Services Tenant	You can provision an SAP Cloud Identity Services tenant for your SAP Business Data Cloud to allow users to sign in to the SAP BDC tenant and to other SAP products using single sign-on (SSO). See Authentication Options. **i Note** Bundled SAP Cloud Identity Services Tenants will follow a controlled release. You will only see this feature if it is available for your tenant. See SAP Note 3619907.
Integration with SAP S/4HANA Cloud Public Edition	SAP S/4HANA Cloud Public Edition is a best-of-breed enterprise software for big data, designed to help you run simple in the digital economy. You can now integrate an instance of SAP S/4HANA Cloud Public Edition with your SAP Business Data Cloud landscape as a data provider. See Integrating SAP S/4HANA Cloud Public Edition to SAP Business Data Cloud.
Import Terms and Key Performance Indicators	If you have terms or key performance indicators in other applications, you can import them into the catalog via a Microsoft Excel spreadsheet. See these topics: • Import Glossary Terms • View Details About Glossary Term Import • Import Key Performance Indicators • View Details About Key Performance Indicator Import
Share Data Products to SAP Customer Data Platform	Users with the appropriate privileges can share data products to SAP Customer Data Platform. See Sharing Data Products to SAP Systems.
SAP Datasphere Models Included in the **Impact and Lineage Analysis** Diagram for an SAP Analytics Cloud Insight	When viewing the **Impact and Lineage Analysis** diagram for an SAP Analytics Cloud insight, users will be able to see models from the local SAP Datasphere system in the insight's lineage.

Title	Description
	Note For insights saved before this update, follow these steps to ensure that the lineage appears as expected. 1. In SAP Analytics Cloud, open the insight and save it. 2. Wait a few minutes as the catalog extracts the object's metadata and updates the associated asset. 3. On the catalog search page, search for the insight and view its details page. 4. Select **Open Lineage and Impact** to see the diagram. See Catalog Asset Details.
Improved Share Status Monitoring for Data Products Shared to Target Systems	The share status for data products will be monitored for changes on the target system every 24 hours and updated in the catalog as needed: • If the data product share is deleted from the target system, the data product's share status is updated to **Shareable**. • If the data product's current share status is **In Progress** for longer than one hour, but the data product was not shared to the target system, the share status is updated to **Shareable**. • When the data product is shared with the target system and the share status has been **In Progress** for more than an hour, it is changed to **Shared**.

Usability Improvements to Enhance Your Catalog Experience	The following usability improvements will help users with the appropriate permissions manage assets, terms, and key performance indicators (KPIs) and monitor source systems.
	• Updated pages for creating and managing glossary terms and KPIs.
	• Addition of visual cues for areas where AI-generated content is used for enriching content.
	• Updated avatar and colors for all objects in the grid view on the catalog search page.
	• Updated source property groupings for metadata on the asset details page.
	• Renamed the main monitoring page to **Metadata Extractions** to match the side navigation.
	• Renamed the systems table on the **Metadata Extractions** page to **Remote Systems**, plus these other updates:
	  ○ Reorganized the information so that it's easier to locate and understand.
	  ○ Moved system-specific actions from the toolbar to the system's row (for example, **Configure** is available only for SAP BW systems).
	• Updated the system's details page by adding a toolbar to the header section. Thus, users can perform actions on the system without having to go back to the main monitoring page.
	
	See the following topics:
	• Using Key Performance Indicators
	• Create and Manage Key Performance Indicators
	• Define the Key Performance Indicator Template
	• Create and Manage a Glossary

Title	Description
	• Create and Manage Glossary Terms • Catalog Asset Details • Connecting Source Systems
Integration with SAP Customer Data Platform	SAP Customer Data Platform is a real-time customer data management solution that unifies, enriches, and activates customer profiles across systems to deliver personalized and privacy-compliant experiences. You can now integrate an instance of SAP Customer Data Platform with your SAP Business Data Cloud landscape as a data product consumer. See Integrating SAP Customer Data Platform to SAP Business Data Cloud.
BW Query Objects Included in the **Impact and Lineage Analysis** Diagram for an SAP Analytics Cloud Story	When viewing the **Impact and Lineage Analysis** diagram for an SAP Analytics Cloud story that is based on a live data model, users will be able to see BW Query objects in the story's lineage. See Catalog Asset Details.
SAP Datasphere Tables Included in the **Impact and Lineage Analysis** Diagram for a Data Product	When viewing the **Impact and Lineage Analysis** diagram for a data product that is from an SAP Datasphere source system, users will be able to see tables from the local SAP Datasphere system in the data product's lineage.
Installation / Activation Issue Cleanup Support	To further improve recovery, you can clean up artifacts from the failed installation and uninstallation, or activation and deactivation, directly from the **Intelligent Applications and Data Packages** page, enabling you to reset your environment to its initial state. See Installing Intelligent Applications and Activating Data Packages.
Connectivity Test	You can now test connectivity to your source systems at any time, and in addition, benefit from the automatic connectivity test that's triggered when selecting a source system in the **Installation/Activation** dialog. This allows you to make sure that the installations and activations proceed successfully. See Installing Intelligent Applications and Activating Data Packages.
SAP Business Data Cloud Product Suite in SAP for Me	In the **Portfolio & Products** dashboard of SAP for Me, individual access cards were replaced by a single unified card that brings all of your purchased product suites into one place. See Provisioning and Configuring SAP Business Data Cloud in SAP for Me.
Intelligent Applications	Insight apps have been renamed to intelligent applications. Intelligent applications are low-code applications that are delivered to the user as SAP Analytics Cloud stories (or analytical applications), supported by SAP Datasphere content. See Installing Intelligent Applications.
Release of SAP Databricks in SAP Business Data Cloud	SAP Databricks, as a part of SAP Business Data Cloud, unifies semantically rich, business-ready data with industry-leading AI/ML and data engineering capabilities. SAP Databricks is fully integrated with the SAP landscape and provides a serverless offering that enables you to bring SAP and non-SAP data together in a pro-code environment for generating business insights. See Introducing SAP Databricks.
Installation / Activation Issue Recovery Improvement	To further improve recovery from installation or activation issues, the following options are now available: • You can retry directly from the intelligent application / data package page, enabling you to maintain fully functioning landscapes.

Title	Description
	• You can locate the detailed failure reason on the **Intelligent Applications and Data Packages** page, which facilitates failure investigation and ensures a quicker turnaround with the support team. See Installing Intelligent Applications, Uninstalling Intelligent Applications, Activating Data Packages, and Deactivating Data Packages.
Release of SAP Business Data Cloud	Release of SAP Business Data Cloud. For more information, see SAP Business Data Cloud.
